Core Java : its java programming language
Selenium : Automation Tool that is used to automate the web based application

3 Types of applications
1. Web based application - which can access from browsers ex. www.google.com
2. Standalone application - which does not require any internet connection like calculator, camera, paint, notepad
3. Mobile based applications - which can be downloaded from playstore or IOS Exa, whatsapp , instagram

Official website of selenium : https://www.selenium.dev/

Any application will have backend and front end

Editor tool which we are going to use in this course for writing code
-Eclipse Oxygen
https://www.eclipse.org/downloads/packages/release/oxygen/r

After installing Eclipse , we are going to follow 3 steps
1. Create Project (can have many packages in it)
2. Create Package (In single package. We can have manuy classes /interfaces)
3. Create Class (We write program)

Hierarchy
Project > Package > Class
Example
Univercity >> Many colleges >> many classes
